

File No: NA/300

Date: 2 July 1996

**NATIONAL INDUSTRIAL CHEMICALS NOTIFICATION
AND ASSESSMENT SCHEME**

FULL PUBLIC REPORT

Polymer G1431

This Assessment has been compiled in accordance with the provisions of *the Industrial Chemicals (Notification and Assessment) Act 1989* (the Act), and Regulations. This legislation is an Act of the Commonwealth of Australia. The National Industrial Chemicals Notification and Assessment Scheme (NICNAS) is administered by Worksafe Australia which also conducts the occupational health & safety assessment. The assessment of environmental hazard is conducted by the Department of the Environment, Sport, and Territories and the assessment of public health is conducted by the Department of Health and Family Services

For the purposes of subsection 78(1) of the Act, copies of this full public report may be inspected by the public at the Library, Worksafe Australia, 92-94 Parramatta Road, Camperdown NSW 2050, between the hours of 10.00 a.m. and 12.00 noon and 2.00 p.m. and 4.00 p.m. each week day except on public holidays.

For Enquiries please contact the Administration Coordinator at:

Street Address: 92 Parramatta Rd Camperdown, NSW 2050, AUSTRALIA

Postal Address: GPO Box 58, Sydney 2001, AUSTRALIA

Telephone: (61) (02) 577-9466 **FAX (61) (02) 577-9465**

Director
Chemicals Notification and Assessment

FULL PUBLIC REPORT**Polymer G1431****1. APPLICANT**

International Sales and Marketing Pty Ltd of 262 Highett Road HIGHETT VIC 3190 has submitted a limited notification statement in support of their application for an assessment certificate for the polymer G1431.

2. IDENTITY OF THE CHEMICAL

Polymer G1431 is not considered to be hazardous based on the nature of the chemical and the data provided. Therefore the chemical name, CAS number, molecular and structural formulae have been exempted from publication in the Full Public Report and the Summary Report

The notified chemical contains no hazardous impurities at levels necessary to classify it as a hazardous substance (1). Therefore, certain information on the purity of the chemical has been exempted from publication in the Full Public Report and the Summary Report.

Trade Name: G 1431

Method of Detection and Determination: The following analytical spectra were provided: Infrared Spectroscopy (IR) used for identification; ^1H -NMR, ^{13}C -NMR and ^{29}Si -NMR spectra were provided to determine structure; Gel Permeation Chromatography (GPC) used to determine molecular weight and weight distribution

3. PHYSICAL AND CHEMICAL PROPERTIES

Appearance at 20°C and 101.3 kPa: a colourless to yellow liquid

Odour: characteristic (not specified)

Boiling Point: not determined

Glass-Transition Temperature: not determined

Density: 1023 kg/m³ @ 25°C

Vapour Pressure:	not determined, expected to be low
Water Solubility:	not available
Surface Tension:	31.6 mN/m and 24.8 mN/m at 20°C at concentrations of 1 g/L and 10 g/L respectively
Fat Solubility:	not determined
Partition Co-efficient (n-octanol/water):	not determined
Hydrolysis as a Function of pH:	not determined
Adsorption/Desorption:	not determined
Dissociation Constant:	not applicable
Flash Point:	>100°C
Flammability Limits:	not determined
Combustion Products:	SiO ₂ , CO ₂ , H ₂ O
Autoignition Temperature:	not determined
Explosive Properties:	not determined
Reactivity/Stability:	stable under room conditions
Particle Size Distribution:	not applicable

Comments on physico-chemical properties

The melting and boiling point of the notified substance have not been determined. This is acceptable due to the polymeric nature of the substance.

The attempted determination of the water solubility of the polymer following a procedure corresponding to the OECD Guideline 105, failed due to the surface activity (please see below). The notified polymer was found to be miscible with water in any proportion by forming opaque micellar solutions. At higher concentrations, the mixture has become milky white and no phase separation has been observed.

The surface tension of aqueous solutions of the polymer was determined by the ring tensiometer method following OECD Guideline 115. The low surface tension obtained for aqueous polymer solutions confirmed the surface active property of the polymer.

The notifier claims that there is no hydrolysis of the polymer expected in the normal pH range of 4-9. However, the polymer will undergo hydrolysis at pH < 2 and pH > 11 and high temperatures (> 90 °C). Although, considered generally stable in the environment, significant cleavage of siloxane bonds by hydrolysis can occur in certain soil types and at a range of pH values, producing water soluble, dimethyl-silanediol as the major product (2). Small amounts of low molecular weight, volatile, cyclics may also result under certain conditions (3).

The partition coefficient and adsorption/desorption will be difficult to measure due to the surface active property of the polymer.

4. PURITY OF THE CHEMICAL

Degree of Purity: 77%

Toxic or Hazardous Impurities: none

Other Impurities: 17%

Additive(s)/Adjuvant(s):

<i>Chemical name:</i>	dipropylenglycol
<i>Synonyms:</i>	not known
<i>CAS No.:</i>	26265-71-8
<i>Weight percentage:</i>	≅ 5%

5. USE, VOLUME AND FORMULATION

The notified polymer will not be manufactured in Australia but imported at a total estimated quantity of 60 tonnes as the pure chemical. The notified polymer will be used as a surfactant (foam stabiliser) in the manufacture of polyurethane. It will be added to the polyurethane system up to 2%.

6. OCCUPATIONAL EXPOSURE

The notified polymer will be imported as a liquid at 77% concentration in 200 litre sealed drums, shipped in 20 foot containers, each containing approximately 78 drums. From the wharf containers are transported by road to stores, and the drums are unpacked and stored in racks in banded areas, until delivered to customers by trucks. One truck driver and one storeman will be involved in the above operations of the notified polymer. Direct contact with the notified polymer is envisaged only in the event of a drum breakage.

The notified polymer is pumped from drums to the mixing head via a hose for mixing with other ingredients for approximately 4 hours per day for 5 days a week. The mixing will be carried out under local exhaust ventilation. One maintenance person, two machine operators and one storeman will be exposed to the notified polymer

during the above operation. The operators will monitor the flow rates, observe the quality of the finished product, and make adjustments to the blend of chemicals via a computer key board or manually actuating a flow valve. During these operations rarely will contact be made with liquids containing the notified polymer. However, contact with the notified polymer is possible during manual connecting of hoses to the drums.

7. PUBLIC EXPOSURE

No public exposure to the notified polymer is expected during storage and transport except in the event of accidental spillage. However, spills are to be contained in absorbent material, which will be disposed of by incineration in accordance with local regulations.

The notified chemical will not be sold to the general public. The public may be in contact with the foam products, but the polymer is not available for absorption since the notified polymer has a number-average molecular weight (NAMW) > 1000 and is bound to the cured foams.

Since the notified polymer is bound to the cured foam, the notified polymer in the waste foam is likely to remain immobile. Public exposure to the notified polymer is expected to be negligible.

8. ENVIRONMENTAL EXPOSURE

Formulation, handling and disposal

There will be no environmental release during transport except during a major accident. Any spillage will be contained by absorbent material and after recovery will be disposed of by incineration in accordance with local regulations.

The foam manufacturing takes place in a factory designed and built according to EPA regulations. At the factory, the notified polymer is used in a continuous polyurethane foam production process in which the polymer is incorporated into the cured polyurethane foam. The polymer waste from washing used drums will be removed and disposed of by a licensed waste handler and the drums will be recycled. The amount of waste generated at the foam manufacturing plant is estimated to be ca. 0.1% of the polymer used.

Fate

The fate of the bulk of the polymer will be tied to the fate of the finished polyurethane foam. The foam that has been treated with the polymer is expected to be used in making mattresses, furniture, and pillows. Most of the treated foam will be landfilled, either as trimmings during the making of end products or when the end products are disposed of. Solid waste containing the polymer, generated during manufacture of foam is expected to be disposed of through landfill or incineration.

The notified polymer is bound to the finished foam. It also has a high molecular weight. Therefore, the notified polymer in the waste foam disposed to landfill is likely to remain immobile. The high molecular weight will also prevent any bioaccumulation.

Some degree of clay-catalysed degradation of the polymer to linear, water soluble, low-molecular weight siloxanols may occur, this being enhanced by soil drying. Water soluble siloxanols are believed to rapidly mineralise to silicates under environmental conditions(4).

9. EVALUATION OF TOXICOLOGICAL DATA

9.1 Acute Toxicity

Toxicological data are not required for polymers with NAMW > 1000 under the Act. However, the following studies on acute oral toxicity, eye irritation, skin sensitisation and mutagenicity were submitted for siloxanes and silicones, di-Me, 3-hydroxypropyl Me, ethoxylated propoxylated (Abil B 8851), which is compositionally similar to the notified polymer.

Table 1 Summary of the acute toxicity of Abil bB 8851

Test	Species	Outcome	Reference
Acute oral toxicity	Rat	LD ₅₀ >5000 mg/kg	(5)
Eye irritation	Rabbit	non-irritant	(7)
Skin sensitisation	Guinea-pig	non-sensitiser	(9)

9.1.1 Oral Toxicity (5)

Species/strain: Sprague Dawley

Number/sex of animals: 5 males, 5 females

Observation period: 14 days

Method of administration (vehicle): diluted solution given orally by gavage (16.0 ml/kg)

Clinical observations: pilo-erection; hunched posture; loss of mortality; abnormal gait; decreased respiration; and increased salivation (one animal).

Mortality: no deaths

Morphological findings: no abnormalities were noted at necropsy

Test Method: based on OECD Guidelines for Testing Chemicals (6)

LD₅₀: > 5000 mg/kg

Result: low oral toxicity in the rat

9.1.2 Eye Irritation (7)

Species/strain: New Zealand White rabbits

Number of animals: 6

Method of administration: 0.1 ml of Abil B 8842 as a 10% aqueous solution

Draize Scores (8):

<i>Animal</i>	<i>Time after instillation</i>									
	<i>1 day</i>		<i>2 days</i>		<i>3 days</i>		<i>4 days</i>		<i>7 days</i>	
<i>Cornea</i>	<i>o^a</i>	<i>a^b</i>	<i>o^a</i>	<i>a^b</i>	<i>o^a</i>	<i>a^b</i>	<i>o^a</i>	<i>a^b</i>	<i>o^a</i>	<i>a^b</i>

^a opacity discharge			^b area			^c redness			^d chemosis			^e			

Test Method: based on OECD Guidelines for Testing Chemicals (6)

Result: non-irritant to rabbit eye

9.1.3 Skin Sensitisation (9)

Species/strain: Perbright Albino guinea pigs

Number of animals: 10 test, 5 control

Induction procedure: three pairs of injections of 0.1 ml: Abil B 8851; FCA in distilled water (1:1); Abil B 8851 in a mixture of distilled water and FCA (1:1)
topical induction: at day 6, 100% Abil B 8851 for 48 hours

Challenge procedure: a challenge was conducted two weeks after induction using 100% Abil B 8851

Challenge outcome:

Challenge concentration	Test animals		Control animals	
	24 hrs*	48 hrs*	24 hrs	48 hrs
100%	1/10**	0/10	0/5	0/5

* time after patch removal

** number of animals exhibiting positive response

Skin reaction after topical induction: slight erythema and oedema were observed following intradermal injections in the test and control groups

Skin reactions after topical challenge:

no adverse reactions were at the test material and vehicle control sites of the control or test animals at the 24-hour and 48-hour observations, except erythema in one animal at 24-hour observation in the test group

Test Method:

based on OECD Guidelines for Testing Chemicals (6)

Result:

non-sensitiser to guinea pig skin

9.3 Genotoxicity

9.3.1 Salmonella typhimurium Reverse Mutation Assay (10)

Strains:

Salmonella typhimurium TA 1535, TA 1537, TA 100 and TA 98

Concentration range:

8 - 5000 µg/ plate with or without rat liver S9

Toxicity to bacteria:

> 5000 µg/ plate

Metabolic activation:

Arocolor 1254-induced rat liver S9-mix

Solvent:

DMSO

Test Method:

in accordance with OECD Guidelines for Testing Chemicals (6)

Result:

non-mutagenic in bacteria

9.4 Overall Assessment of Toxicological Data

Based on studies done and information provided by the notifier with a compositionally similar chemical (Abil B 8851), the notified chemical may be of low acute oral toxicity in rat, a non-irritant to the eye of rabbit and non-mutagenic to *Salmonella typhimurium* strains TA 1538, TA 11537, TA 100 and TA 98 in an *in vitro* bacterial reverse mutation assay.

On the basis of submitted analog data, the notified chemical will not be classified as hazardous in accordance with *Approved Criteria for Classifying Hazardous Substances* [NOHSC:1008(1994)] in relation to acute oral toxicity, eye irritation, skin sensitisation and mutagenicity.

10. ASSESSMENT OF ENVIRONMENTAL EFFECTS

According to the Act, environmental effects testing is not required for polymers with NAMW>1000 as such polymers are too large to cross biological membranes.

Reviewers have concluded that silicones partition to sediment where they are persistent, but do not exert any adverse environmental effects (11).

11. ASSESSMENT OF ENVIRONMENTAL HAZARD

Most of the polymer will be disposed of to landfill or incinerated with the foam to which it is cured. Incineration of the polymer will produce oxides of carbon, silica and water with no significant environmental hazard.

A small amount of the polymer (ca. 0.1%) contained in the used drums after the foam manufacture will also be removed and disposed of by a licensed waste handler. However, if released to the environment, it may undergo some degradation releasing water soluble siloxanols. Such low-molecular weight species are either volatilised, degraded to silicates, incorporated into humus or oxidised to CO₂.

Overall, the environmental hazard of the polymer can be rated as low under proposed use and disposal methods.

12. ASSESSMENT OF PUBLIC AND OCCUPATIONAL HEALTH AND SAFETY EFFECTS

No data on effects on humans (for the notified polymer) were available for assessment. However, based on results of animal studies done on a compositionally similar chemical, the notified chemical is likely to exhibit low acute oral toxicity and unlikely to present a risk of eye and skin irritation or skin sensitisation to workers. In addition, adverse systemic effects (from dermal adsorption) are unlikely due to the high NAMW of the notified polymer. The level of residual monomers in the notified polymer are unlikely to present a health hazard. There are no hazardous impurities present in sufficient concentrations to render the polymer hazardous.

As the polymer is available in liquid form, skin and eye contact will be the main source of occupational exposure during polyurethane foam manufacture. Inhalational exposure during these activities is unlikely as the polymer vapour pressure is expected to be low and no loss to the working environment will occur as a result of the specificity of the dosing system. The use of local exhaust ventilation would further minimise worker exposure during mixing of the ingredients. However, exposure is still possible during connection of hoses.

The risk of adverse occupational health effects is expected to be low, due to low exposure levels and the high molecular weight of the notified polymer. Precautions against continued exposure to other ingredients should be observed.

Because the notified polymer is bound to the cured foams and has a NAMW > 1000, the polymer is not available for absorption by dermal contact with the foam products. The proposed use of the notified chemical is unlikely to have a significant impact on public health.

13. RECOMMENDATIONS

To minimise occupational exposure to the polymer G 1431 the following guidelines and precautions should be observed during mixing and connecting hoses:

- . safe practices, as should be followed when handling any chemical formulation, should be adhered to - these include:
 - minimising spills and splashes;
 - practising good personal hygiene; and
 - practising good housekeeping and maintenance including bunding of large spills which should be cleaned up promptly with absorbents and put into containers for disposal.
- . It is expected that, in the industrial environment, protective clothing conforming to and used in accordance with Australian Standards (AS) 2919 (12) and protective footwear conforming to Australian/New Zealand Standard (AS/NZS) 2210 (13) should be worn as a matter of course; in addition it is advisable that when handling chemical formulations containing the notified polymer to wear chemical-type goggles (selected and fitted according to AS1336 (14) and meeting the requirements of AS/NZS 1337 (15)), impermeable gloves (AS 2161) (16) should be worn to protect against unforeseen circumstances.
- . a copy of the material safety data sheet (MSDS) should be easily accessible to employees.

14. MATERIAL SAFETY DATA SHEET

The MSDS for the polymer G 1431 was provided in a suitable format.

This MSDS was provided by the applicant as part of the notification statement. The accuracy of this information remains the responsibility of the applicant.

15. REQUIREMENTS FOR SECONDARY NOTIFICATION

Under the Act, secondary notification of the polymer G 1431 shall be required if any of the circumstances stipulated under subsection 64(2) of the Act arise. No other specific conditions are prescribed.
