August 2002

**NATIONAL INDUSTRIAL CHEMICALS NOTIFICATION AND ASSESSMENT SCHEME  
(NICNAS)**

**FULL PUBLIC REPORT**

**Polymer in Rheolate 350**

This Assessment has been compiled in accordance with the provisions of the *Industrial Chemicals (Notification and Assessment) Act 1989* (Cwlth) (the Act) and Regulations. This legislation is an Act of the Commonwealth of Australia. The National Industrial Chemicals Notification and Assessment Scheme (NICNAS) is administered by the National Occupational Health and Safety Commission which also conducts the occupational health and safety assessment. The assessment of environmental hazard is conducted by the Department of the Environment and Heritage and the assessment of public health is conducted by the Department of Health and Ageing.

For the purposes of subsection 78(1) of the Act, this Full Public Report may be inspected at:

Library  
National Occupational Health and Safety Commission  
25 Constitution Avenue  
CANBERRA ACT 2600  
AUSTRALIA

To arrange an appointment contact the Librarian on TEL + 61 2 6279 1161 or + 61 2 6279 1163.

This Full Public Report is available for viewing and downloading from the NICNAS website or available on request, free of charge, by contacting NICNAS. For requests and enquiries please contact the NICNAS Administration Coordinator at:

Street Address:	334 - 336 Illawarra Road MARRICKVILLE NSW 2204, AUSTRALIA.
Postal Address:	GPO Box 58, SYDNEY NSW 2001, AUSTRALIA.

**FULL PUBLIC REPORT****Polymer in Rheolate 350****1. APPLICANTS****Original Holder of Assessment Certificate (First Applicant)**

An Assessment Certificate for the notified chemical known by the name Polymer in Rheolate 350 was granted to BASF Australia Ltd of 500 Princes Highway NOBLE PARK VIC 3174 ((ABN No. 62 008 437 867) and International Sales and Marketing Pty Ltd of 55 Halstead Street SOUTH HURSTVILLE NSW 2221 (ABN No. 36-467-259-314).

The Assessment Report for Polymer in Rheolate 350 is identified by the sequence number PLC/137.

**Second Applicant**

Since granting of the abovementioned Assessment Certificates, Bonakemi Australia Pty Ltd C/O Swedish Trade Council of 25<sup>th</sup> Floor 44 Market Street SYDNEY NSW 2000 ((ACN No 35 096 221 448), and Ezi Floor Products of 36 Sydenham Road NORWOOD SA 5067 (ACN No. 85 085 852 198) have submitted a notification statement in support of their application for an extension of the original Assessment Certificate for Polymer in Rheolate 350. BASF Australia Ltd and International Sales and Marketing Pty Ltd have agreed to this extension.

Information submitted by Bonakemi Australia Pty Ltd and Ezi Floor Products pertains to the introduction of the notified polymer for use as an ingredient of waterborne polymeric floor finish, pre-packaged in 5 litre polyethylene containers at a concentration of around 0.2%.

Under Section 40E of the Act, this modification of the Full Public Report is provided to Bonakemi Australia Pty Ltd and Ezi Floor Products for consideration. This modification is also provided to the original certificate holders BASF Australia Ltd and International Sales and Marketing Pty Ltd, the relevant sections of the Assessment and Full Public Reports for PLC/137 will be amended to include the modifications.

No application for Exempt Information was received for the Extension.

Under Section 40G of the Act, the amended Assessment Report for PLC/137 will be republished and provided to: the Chief Executive Officer of the National Occupational Health and Safety Commission; the Secretary of the Department of the Environment; and the Secretary of the Department of Health and Ageing.

**2. IDENTITY OF THE CHEMICAL**

The chemical name, CAS number, molecular and structural formulae, molecular weight, details of the polymer composition, and details of customers and end uses have been exempted from publication in the Full Public Report.

<b>Marketing Name:</b>	Rheolate 350
<b>Method of Detection and Determination:</b>	infrared (IR) spectroscopy
<b>Spectral Data:</b>	2870, 1470, 1375, 1360, 1350, 1325, 1280, 1250, 1125, 1040, 995, 950, 880, 845 cm <sup>-1</sup>

*Characterisation as a Synthetic Polymer of Low Concern*

<b>Number-Average Molecular Weight (NAMW):</b>	> 1000
<b>Maximum Percentage of Low Molecular Weight Species</b>	
<b>Molecular Weight &lt; 500:</b>	< 1
<b>Molecular Weight &lt; 1 000:</b>	< 1
<b>Polymer Stability</b>	stable under normal environmental conditions
<b>Reactivity</b>	not reactive
<b>Charge Density</b>	not charged

The polymer meets the criteria for assessment as a synthetic polymer of low concern under Regulation 4A of the *Industrial Chemicals (Notification and Assessment) Act 1989*.

### 3. PHYSICAL AND CHEMICAL PROPERTIES

The notified polymer is imported in a solution containing 50 % polymer (Rheolate 350) in water. The physical and chemical properties given below are variously those of the solution or the notified polymer itself, as stated.

<b>Appearance and 101.3 kPa:</b>	<b>at 20°C</b>	opaque solid or paste; imported as a hazy or cloudy yellow-brown liquid
<b>Boiling Point:</b>		103°C for the solution
<b>Specific Gravity:</b>		1.02 for the solution
<b>Water Solubility:</b>		dispersible in water
<b>Dissociation Constant:</b>		no groups likely to dissociate are present
<b>Autoignition Temperature:</b>		product is not self-igniting
<b>Explosive Properties:</b>		not expected to be explosive
<b>Reactivity/Stability:</b>		stable below 48°C

#### Comments on Physico-Chemical Properties

No test reports were provided for any of the above physico-chemical properties.

The water solubility test report was not provided, however, based on the polyether structure of the notified chemical, high water solubility is expected.

There are no groups present which are generally considered to hydrolyse. The notifier has stated that, in general, polyether products are stable even at elevated temperatures (48°C) and do not thermally decompose until temperatures exceed 200°C. It is noted that all polyether products undergo oxidative degradation to form organic byproducts such as aldehydes and acids. This process is slow at room temperature but the rate increases with increasing temperature. The notifier has stated that, in general, at 48°C, approximately 100 ppm of aldehyde and organic acids may form. No indication of the rate of formation was provided.

The polymer is non-ionic and does not contain positively or negatively charged groups.

#### 4. PURITY OF THE CHEMICAL

**Degree of Purity:** 99 %

**Hazardous Impurities:** the notified polymer contains hazardous residual monomers at concentrations below the cut-off levels for classification of the polymer as a hazardous substance; the identity of the residual monomers has been claimed as exempt from publication in the Full Public Report

**Non-hazardous Impurities** none  
(> 1% by weight):

**Maximum Content** < 1 %, see above  
**of Residual Monomers:**

**Additives/Adjuvants:** none

#### 5. USE, VOLUME AND FORMULATION

##### **BASF Australia Ltd and International Sales and Marketing Pty Ltd**

The notified polymer will be used as a component of water based architectural paints.

The notified polymer will be imported in the form of Rheolate 350, containing 50 % notified polymer, in 204 kg plastic drums. Rheolate 350 will be reformulated at a number of paint manufacturing sites to produce the finished paints. The finished paints would generally contain less than 5 % notified polymer. The finished paints will be packaged into 500 mL, 1 L and 4 L cans and marketed to tradesmen and to members of the general public.

The anticipated import volume is 2500 kg per annum over the first five years of importation.

##### **Bonakemi Australia Pty and Ezi Floor Products**

The notified polymer will also be imported as a component in a waterborne polymeric floor finish pre-packed in 5 litre polyethylene containers at a concentration of about 0.2%. The notified polymer will be imported in this form at a rate of 0.3 tonnes per year in the first year, gradually rising to 0.5 tonnes per year in the fifth year. No re-packaging or reformulation of the floor finish product will be done in Australia.

#### 6. OCCUPATIONAL EXPOSURE

##### **BASF Australia Ltd and International Sales and Marketing Pty Ltd**

*Transport and Storage*

The notified polymer will be imported as part of the products Rheolate 350. The product is liquid, and packed in 204 kg plastic drums. No exposure is expected during transport and storage, except in the case of an accident involving damage to the packaging.

#### **Paint Manufacture**

The notifier indicates that the notified polymer is expected to be handled by 30 factory workers and 2 paint chemists.

The products may be used at a large number of sites for reformulation into architectural paints. Reformulation will involve transfer of the liquid, containing 50 % notified polymer, into mixing pots, where it will be blended with water, polymer emulsions and other additives to produce paints. Transfer is likely to be by decanting, although drum pumps may also be used. Dermal exposure to drips and spills of the products is possible during the transfer.

The formulated product (< 5 % notified polymer) is filled into 500 mL, 1 L or 4 L steel cans. Dermal exposure to the < 5 % solution of notified polymer is possible during filling.

Warehouse workers will handle the drums of polymer solution and also the filled cans of finished paint, but no exposure is expected unless the packaging is ruptured.

Paint chemists would be expected to sample the raw materials and paints for quality control purposes, and may be dermally exposed to the paint during sampling and testing.

The notifier states that extraction systems are generally present at each work station. Workers in the paint reformulation sites generally wear overalls, safety glasses, gloves and safety boots.

#### **Paint Sales and Application**

The paints containing the notified polymer will be available to both professional painting contractors and do-it-yourself home painters. Paint application will generally be done by brush or roller, although spray painting may also occur. Occupational contact with the notified polymer can occur during the tinting of paints at point of sale by the store staff, and during the application of the paints by professional painting contractors. The exposure for these workers will be to the finished paint containing < 5 % notified polymer, and would normally be dermal. No details of the types of personal protective equipment used to prevent exposure for these workers was provided by the notifier.

After application of the paint, it will cure and crosslink, and the notified polymer will no longer be separately available for exposure.

Handling and application instructions will be provided on the end use product labels for use by contract and domestic do-it-yourself painters.

#### **Bonakemi Australia Pty and Ezi Floor Products**

##### **Transport and storage**

Similarly, no exposure is expected during the transfer and storage of containers of imported floor finish product.

## **7. PUBLIC EXPOSURE**

Dermal and possibly eye contact with the notified polymer may occur during application of the paints containing the polymer by the general public, and dermal contact with surfaces coated with the notified polymer is likely. If contact occurs, exposure would be low, because of the low concentration (< 5 %) of notified polymer in the paints, the cured state of the polymer on the coated surface, and the high molecular weight of the notified polymer, which will preclude absorption across the skin or other biological membranes.

## **8. ENVIRONMENTAL EXPOSURE**

### **Release**

**BASF Australia Ltd and International Sales and Marketing Pty Ltd**

Release of the notified polymer is expected to occur at various stages of reformulation and application.

The notifier has not provided an estimate of release during decanting/transfer, mixing, equipment cleaning and repackaging as part of paint manufacturing operations, nor during disposal of containers used for the products containing the notified polymer or end use of the products. However it is reasonable to estimate that approximately 3 % will be released as spills, 1.5 % for equipment cleaning and 0.5 % for quality testing - a total of 5 % (125 kg per annum). The notifier has provided generic waste trapping technology information for one potential reformulation site. This site is designed so that all liquid waste is trapped in a series of trade waste traps. The solid components of the waste are disposed of via a commercial waste contractor and either destroyed by incineration or sent to landfill. Liquid waste components are analysed by the relevant water authority before receiving approval for discharge to the sewer.

On the basis of experience with similar products, it is possible to estimate that approximately 3 % (w/w) of the notified polymer will remain in both the empty import drums and the wholesale/retail cans which will then be disposed of to land fill. Approximately 75 kg of notified polymer will be released annually via this pathway.

It is possible to estimate that residues of the notified polymer remaining in or on paint application equipment or as drips and spills will be approximately 0.5 % of import volume (w/w). This represents approximately 12.5 kg of notified polymer per year. Depending on the solvent used to clean the equipment, it is assumed that much of this will be disposed of to sewer or to soil.

Release may arise through spillage in transport accidents which may release the polymer, in solution or in paints, to terrestrial or aquatic environments. Paint spills are expected to be limited due to the small tin sizes. Risk of release of the polymer solution will be greater than that of paints but still low.

The total release of polymer (assuming an annual import volume of 2.5 tonnes and the above release estimates) is expected to be approximately 212 kg per year.

**Bonakemi Australia Pty and Ezi Floor Products**

The imported floor finish product will be available to both professional workers and the DIY market. Application would be with rollers or other suitable applicators. The notifiers anticipate that less than 1% will remain as residue in empty containers (50g per container), and 2% may be lost during cleaning of application equipment.

Containers would be disposed of as landfill while material lost during cleaning is assumed to be released to the sewer system. These annual amounts are estimated to be a maximum of 5 kg and 10 kg per annum respectively.

**Fate****BASF Australia Ltd and International Sales and Marketing Pty Ltd**

Approximately 212 kg of the notified polymer is expected to be released per year as residues in containers and as a result of reformulation and equipment cleaning processes.

Approximately 0.5 % of the waste polymer is expected to be released as a result of cleaning brushes or drips and spills. It is assumed that much of this will be inappropriately disposed of to sewer or to soil.

The majority of polymer waste (8 % of imports) is expected to be disposed of to landfill or incinerated. Incineration of the notified polymer will liberate water and oxides of carbon.

The majority of polymer waste disposed of to landfill will be as a liquid or solid paint and little is expected to migrate through the soil profile in this form. If released as a polymer solution, it is expected to be mobile in the soil profile due to its high water solubility. If released to water, the polymer solution is expected to readily disperse.

It is difficult to predict the course of degradation of the notified polymer in the environment, particularly in the absence of polymer specific physico-chemical data. It is anticipated that the polymer will slowly degrade via

aerobic, anaerobic and abiotic processes. Degradation products are expected to ultimately be carbon dioxide and water. The moderately high molecular weight suggests that bioaccumulation is unlikely to occur (Connell, 1990).

#### **Bonakemi Australia Pty and Ezi Floor Products**

Based on an anticipated release to sewer of 10 kg per year around the country, the predicted concentration in sewage treatment plants will be under 1 µg/L (ppb) which will then be further diluted on release to receiving waters (assumes use on 300 days per annum with an average water use of 150 L per person per day and a national population of 19 million people).

### **9. EVALUATION OF TOXICOLOGICAL DATA**

No toxicology data were submitted.

### **10. ASSESSMENT OF ENVIRONMENTAL EFFECTS**

No ecotoxicological data were submitted.

### **11. ASSESSMENT OF ENVIRONMENTAL HAZARD**

It is expected that approximately 212 kg per annum of the notified polymer will eventually be disposed of to landfill across several sites as a result of reformulation and equipment cleaning and as residues in containers. If disposed of as a component of solid or liquid paint, mobility and solubility are expected to be minimal and once in the solid form the notified polymer is considered to be of minimal hazard to the environment.

The main environmental hazard would arise through spillage in transport accidents which may release the polymer solution to the soil or to drains and waterways. The polymer solution is expected to be mobile in the soil profile due to its high water solubility. If the liquid polymer solution is accidentally released into an aquatic system, it is expected to readily disperse. In either a soil or aquatic environment, the polymer is expected to degrade via biotic and abiotic processes to its constituent monomers, although the rate of degradation is not known. The monomers may be toxic but are expected to degrade relatively quickly.

The product Material Safety Data Sheet (MSDS) appears to adequately address accidental release measures.

The polymer in the forms in which it will be used within Australia is likely to present a low hazard to the environment.

### **12. ASSESSMENT OF PUBLIC AND OCCUPATIONAL HEALTH AND SAFETY EFFECTS**

No toxicological information has been provided for the notified polymer and therefore the substance cannot be assessed against the NOHSC *Approved Criteria for Classifying Hazardous Substances* (NOHSC, 1999). The overall toxicity of the notified polymer is expected to be low as it is not highly reactive and, having a high molecular weight would not readily cross biological membranes. The MSDS indicates that the solutions containing the notified polymer are skin and eye irritants, but not sensitisers. Polyethers in general have skin and eye irritant properties (Sax & Lewis, 1996). The residual monomer concentrations in the finished polymer are below the cutoff levels for classification as a hazardous substance.

#### *Occupational Health and Safety (OHS)*

There is little potential for significant occupational exposure to the notified polymer in the transport and storage of the polymer solution or the paint component containing this polymer. There will be exposure during production of the paint, and in the use and disposal of the paints.

During the paint manufacture processes, the main exposure route for the notified polymer will be dermal. The paints will be viscous, and ready formation of aerosols is not expected. The polymer is not expected to be

hazardous by dermal exposure as the high molecular weight will preclude absorption through the skin. The engineering controls and personal protective equipment specified in the notification (impervious gloves, safety glasses, safety boots and coveralls) will provide a high level of protection against the notified polymer. No significant OHS risks are expected when control and protective measures are implemented.

Occupational exposure during the sale and professional use of the paints is likely to be widespread and often under poorly controlled conditions. Dermal contact during handling and application of the paints is likely. The occupational health and safety risk associated with dermal contact with the notified polymer in the form of uncured paints will be low, due to the low toxicological hazard of the polymer and the low concentration (< 5 %) in the finished paints.

#### **PUBLIC HEALTH**

While dermal and possibly eye contact with the notified polymer may occur during application of the paints containing the polymer by the general public, and dermal contact with surfaces coated with the notified polymer is likely, based on the low potential for public exposure to the notified polymer and its expected low toxicity, the notified polymer is not expected to pose a significant hazard to public health when used in the proposed manner.

### **13. RECOMMENDATIONS**

To minimise occupational exposure to Polymer in Rheolate 350 the following guidelines and precautions should be observed:

- Safety goggles should be selected and fitted in accordance with Australian Standard (AS) 1336 (Standards Australia, 1994) to comply with Australian/New Zealand Standard (AS/NZS) 1337 (Standards Australia/Standards New Zealand, 1992); industrial clothing should conform to the specifications detailed in AS 2919 (Standards Australia, 1987) and AS 3765.2 (Standards Australia, 1990); impermeable gloves or mittens should conform to AS 2161 (Standards Australia/ Standards New Zealand, 1998); all occupational footwear should conform to AS/NZS 2210 (Standards Australia/ Standards New Zealand, 1994b);
- Spillage of the notified chemical should be avoided. Spillages should be cleaned up promptly with absorbents which should then be put into containers for disposal;
- Good personal hygiene should be practised to minimise the potential for ingestion;
- A copy of the MSDS should be easily accessible to employees.

### **14. MATERIAL SAFETY DATA SHEET**

#### **BASF Australia Ltd and International Sales and Marketing Pty Ltd**

The MSDS for the notified chemical was provided in accordance with the *National Code of Practice for the Preparation of Material Safety Data Sheets* (NOHSC, 1994).

This MSDS was provided by the applicant as part of the notification statement. It is reproduced here as a matter of public record. The accuracy of this information remains the responsibility of the applicant.

#### **Bonakemi Australia Pty Ltd and Ezi Floor Products**

An MSDS for the imported floor finish product containing Polymer in Rheolate 350 was provided in a format consistent with the NOHSC *National Code of Practice for the Preparation of Material Safety Data Sheets* (NOHSC 1994b). The accuracy of this information remains the responsibility of the applicant.

### **15. REQUIREMENTS FOR SECONDARY NOTIFICATION**

Under subsection 64(1) of the Act, secondary notification may be required if the polymer characteristics cease to satisfy the criteria under which it has been accepted as a Synthetic Polymer of Low Concern. Secondary

notification of the notified polymer may be required if any of the circumstances stipulated under subsection 64(2) of the Act arise. No other specific conditions are prescribed.
